

AFTERCARE INSTRUCTIONS

Your Definition Brows generally last between 12-18 months, but certain factors such as aftercare, skin regeneration, and body chemistry may prolong or shorten the expected durability.

- Do not apply makeup or facial lotions directly on the brows during healing process.
- Do not use Peroxide or Neosporin on treated areas.
- Do not get the eyebrows wet for 7-10 days during the healing process. If your eyebrows get wet during this time, pat them dry with a towel (DO NOT RUB).
- If your eyebrows scab, become slightly dry, or itchy DO NOT RUB, PICK, OR SCRATCH them during the healing process. Gently tap them to release the itch. You may also apply a small amount of your Definition Brows Protective Balm, as it contains anti-itch ingredients.
- No gym activity for 5-7 days post procedure, any sweating or opening of the pores may reduce pigment retention.
- Avoid excess exposure to the sun or tanning beds as this can make them fade and can affect the healing process.
- DO NOT EVER apply skincare products, especially those containing acid (glycolic acid, salicylic acid, etc.) as well as anti-aging products, skin lightening products (such as Tretinoin/Retin-A), or those that speed up the skin renewal process directly on the eyebrows or surrounding areas. This includes microdermabrasion and laser to the eyebrows.
- No facials, Botox, dermal fillers, or collagen treatments for 6 weeks after procedure.
- Our pigments are MRI safe, but if you are due to have a MRI scan, please inform your doctor that you have had microblading done.
- First 6 weeks: Apply "Protective Balm" as needed to keep treatment area moist at all times.
- 6+ weeks: After area is fully healed, keep area protected with SPF 15 or greater.
- Notify your brow artist if your scheduled 6 week perfecting visit is not needed at least 48 hours in advance.

Once healed, you can enjoy your eyebrows to the fullest!
